

Precision Measurement of the Helium Flux with AMS Experiment

33rd International Cosmic Ray Conference

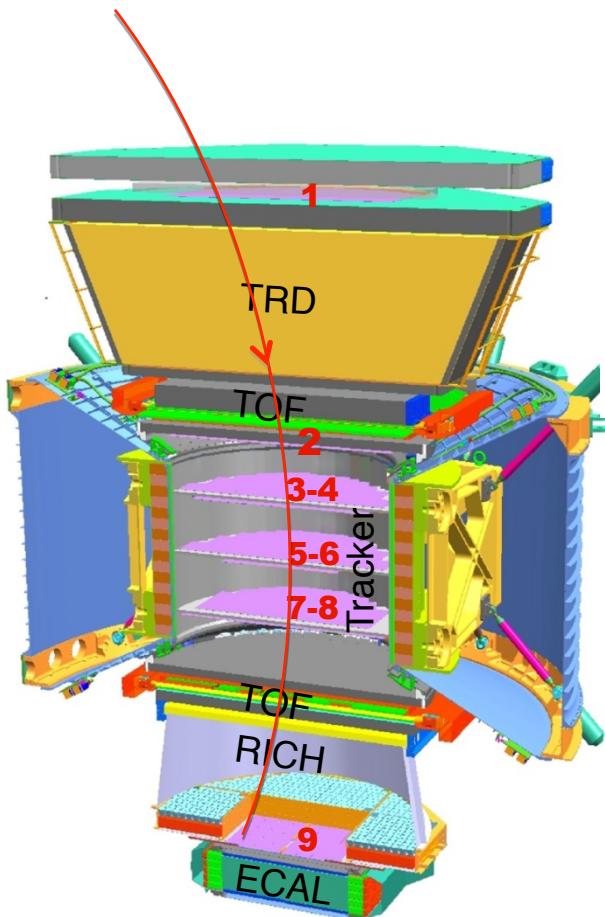

Rio De Janeiro, July 8th 2013

V. Choutko/M.I.T. on behalf of AMS Collaboration

AMS Detector He Properties Measurement

Rigidity, Direction and Charge Sign

Tracker

Bending Coordinate Resolution $6 \text{ to } 7 \mu\text{m}$
MDR ($Z=2$) $\approx 3.2 \text{ TV}$

Velocity and Direction

TOF

$\Delta\beta/\beta^2(Z=2) \approx 2\%$

Charge Magnitude Along He Trajectory

TRD, Tracker, RICH ,TOF, ECAL

$\Delta Z (Z=2) \approx 0.08-0.2$

Helium Selection

(I) Downgoing Particle

$$\beta > 0.3$$

(II) Rigidity (R) Above Geomagnetic Cutoff (R_C)

$$R > 1.2R_C + 2\sigma(R_C)$$

(III) Charge Compatible with that of He along
Particle Trajectory

For instance, for Inner Tracker $1.6 < Z < 2.6$

(IV) χ^2 of the Particle Trajectory Fit < 10

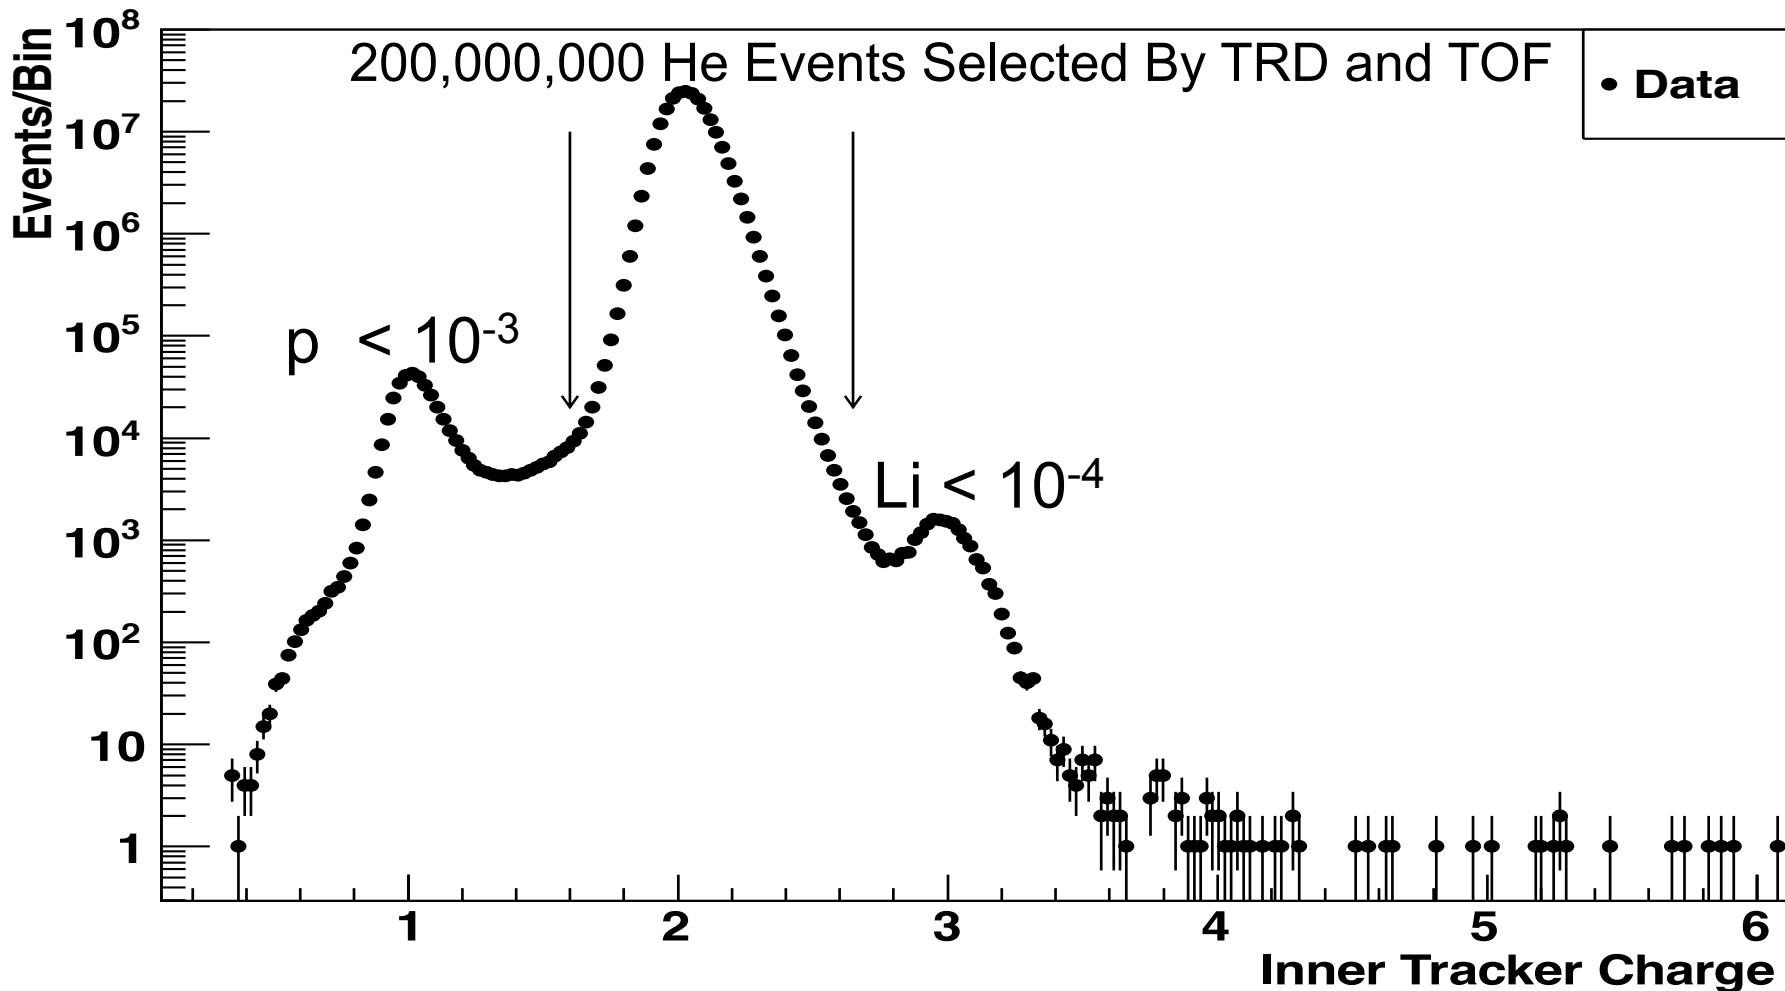

Efficiency 98-99 %, Removes Bulk of Events with
Large Scattering and Wrongly Measured Rigidity

Helium Selection

Proton background: $< 10^{-5}$

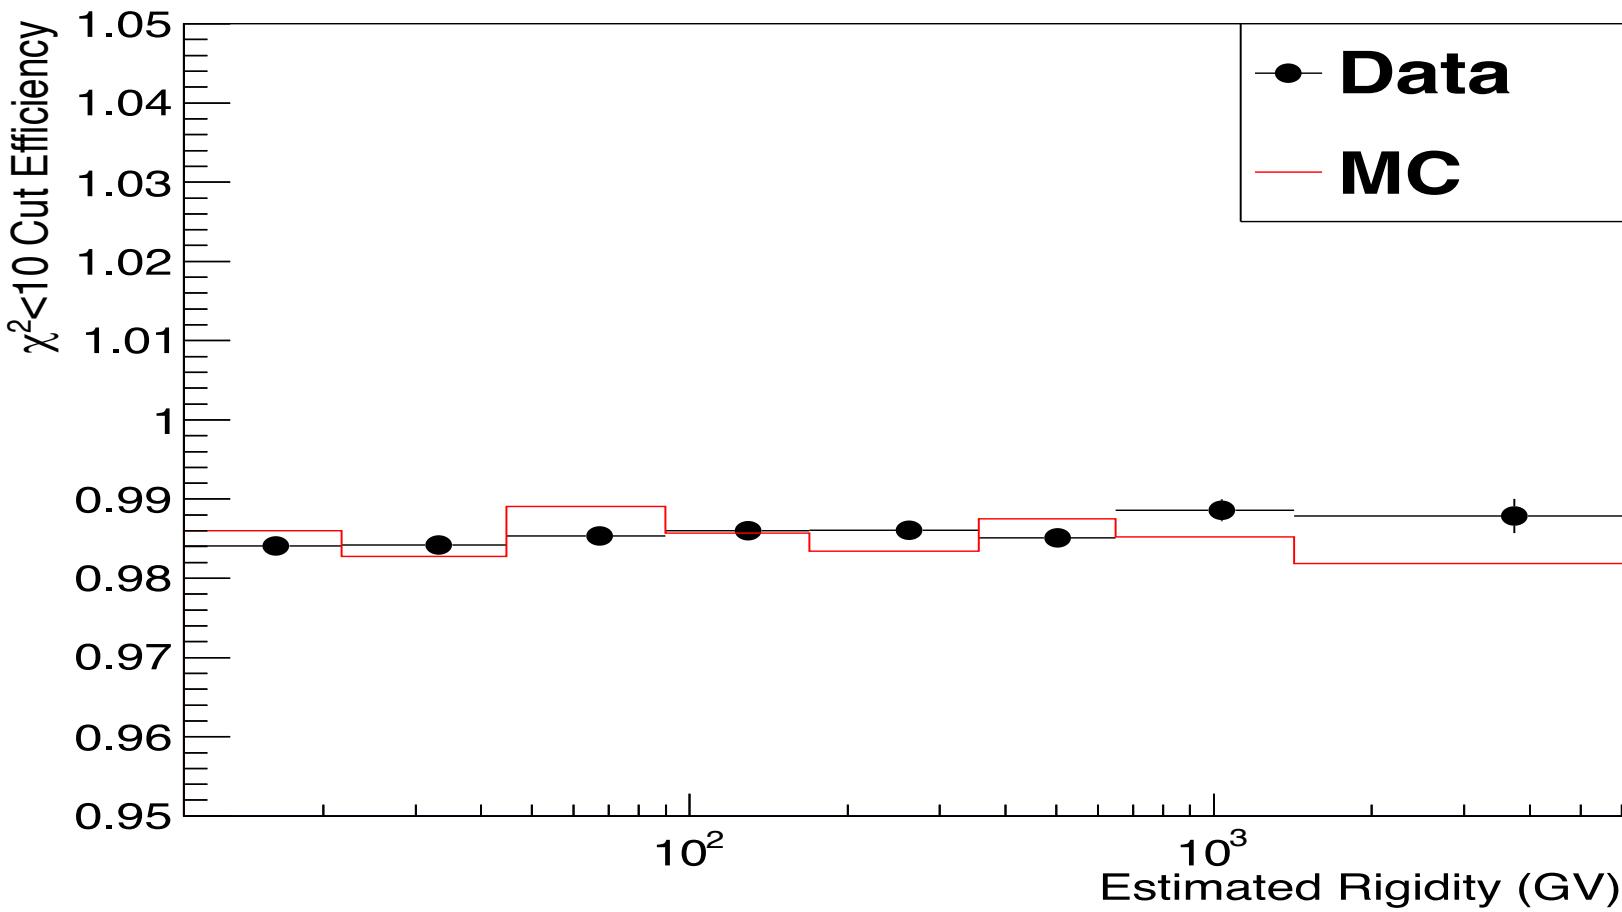

Main Remaining Background: Ions Interacted on Top of AMS $< 10^{-3}$

Selection Efficiency

Data: Rigidity Estimated by ECAL

Flux Measurement

Assuming flux over geomagnetic cutoff is isotropic
the differential He flux can be defined as

$$\Phi(R) = \frac{1}{2\pi(1-\cos\theta_{\max})} \frac{N_{\text{Events}}(R, R+\Delta R)}{T(R) A(R) \varepsilon_{\text{trig+sel}}(R) \Delta R}$$

Y-axis: $\Phi(R)$

R: 2-3200 GV

θ_{\max} : 20°

T: >50 millions seconds

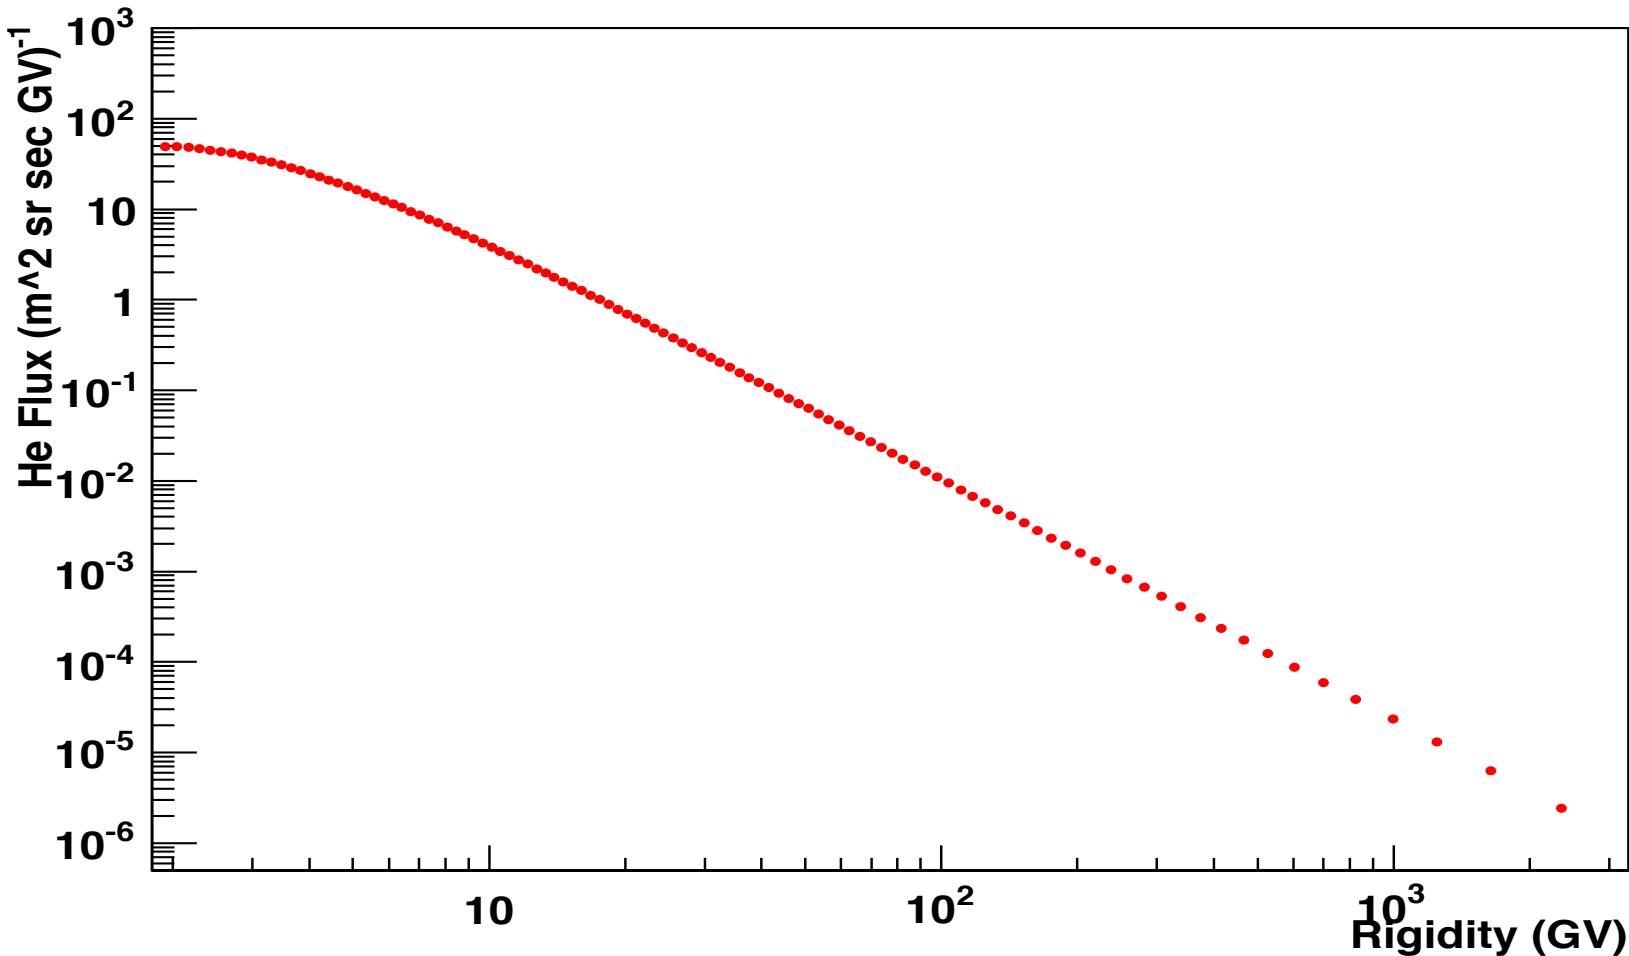

A: $\int d\phi, d\cos\theta$ of Geometrical Acceptance

Trigger & Selection Efficiency

Bin width

He Flux Statistical Errors Only

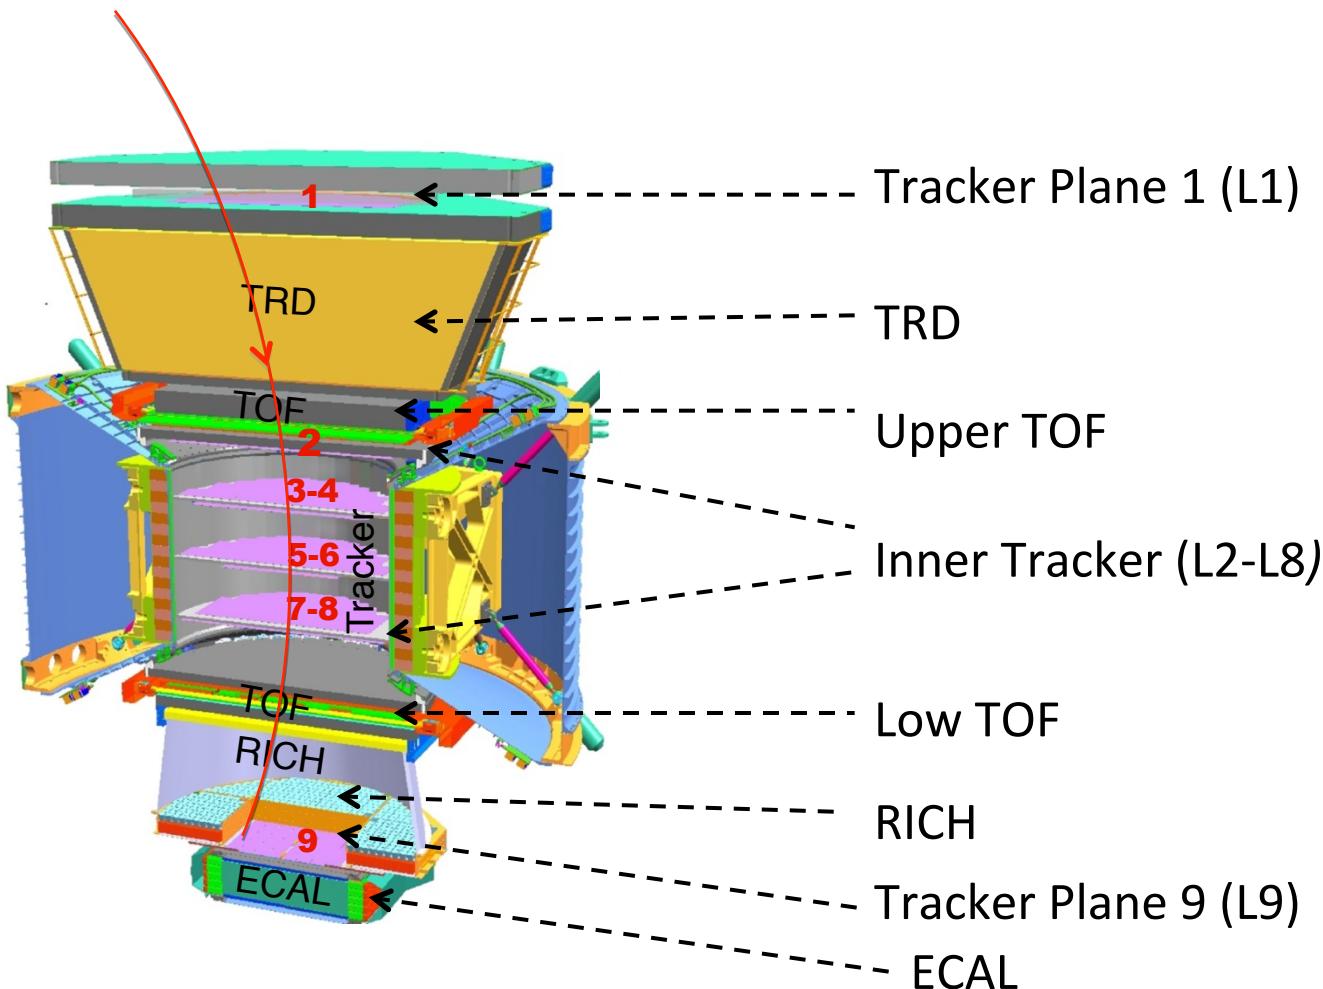

Systematic Errors on Acceptance

Source	Efficiency(%)	Error(%)
Trigger	95-99	0.5
Track and Velocity Fit	95-97	0.7
Event Selection	~80	0.7
• Monte Carlo Statistics		0.7
• Total of The Above		1.3
• Unfolding Errors	<0.5% below 250GV 10% above 2 TV	

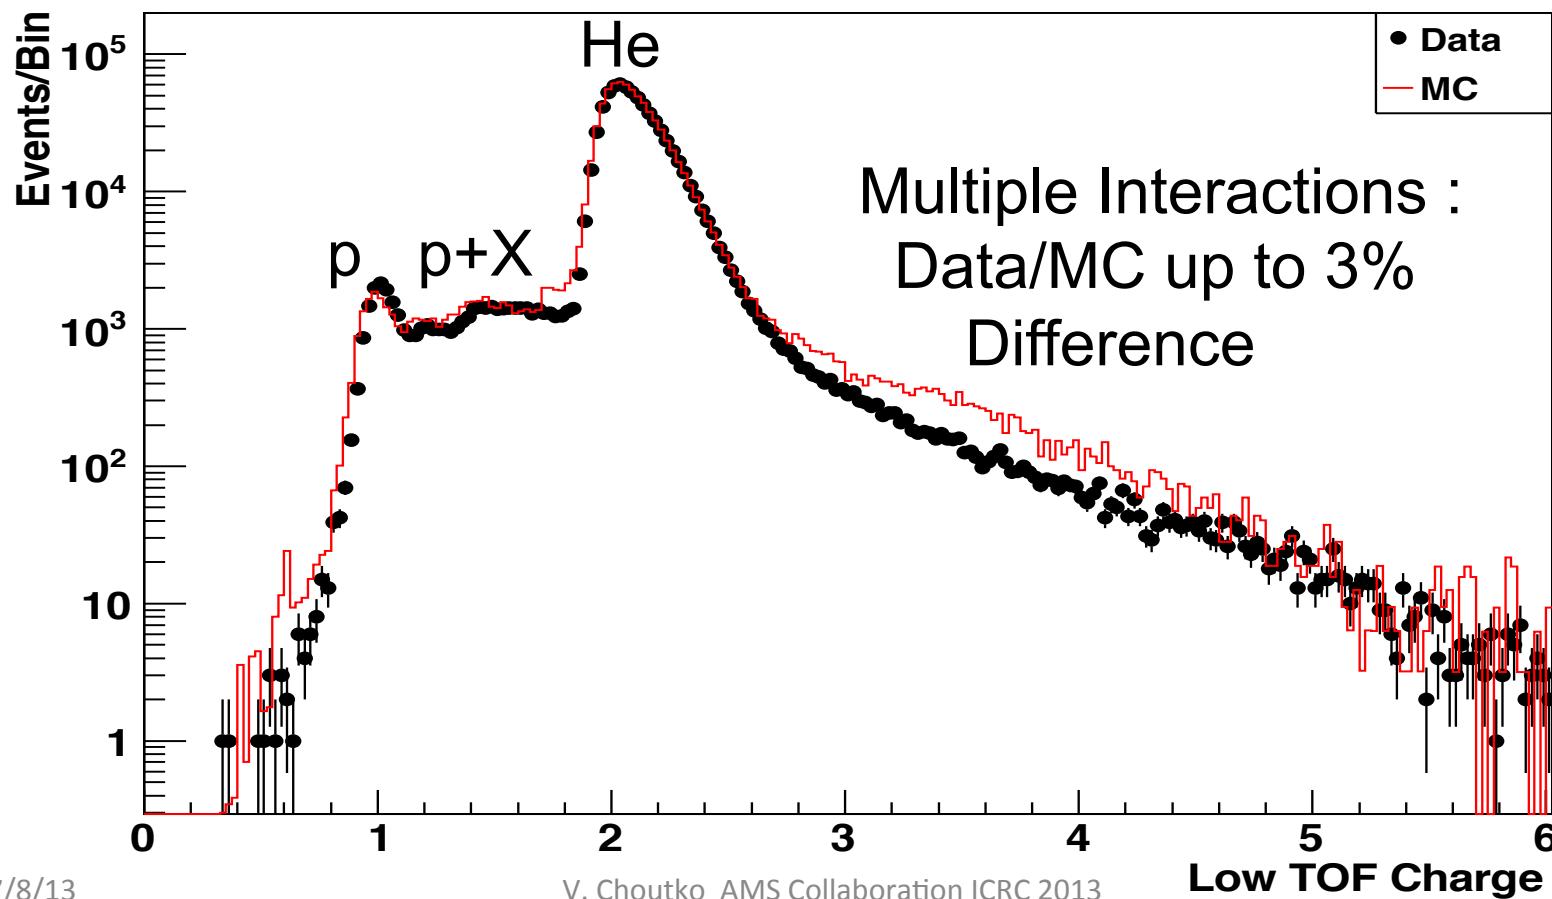

Monte Carlo Helium Interactions Validation by Measuring He Charge Along Trajectory

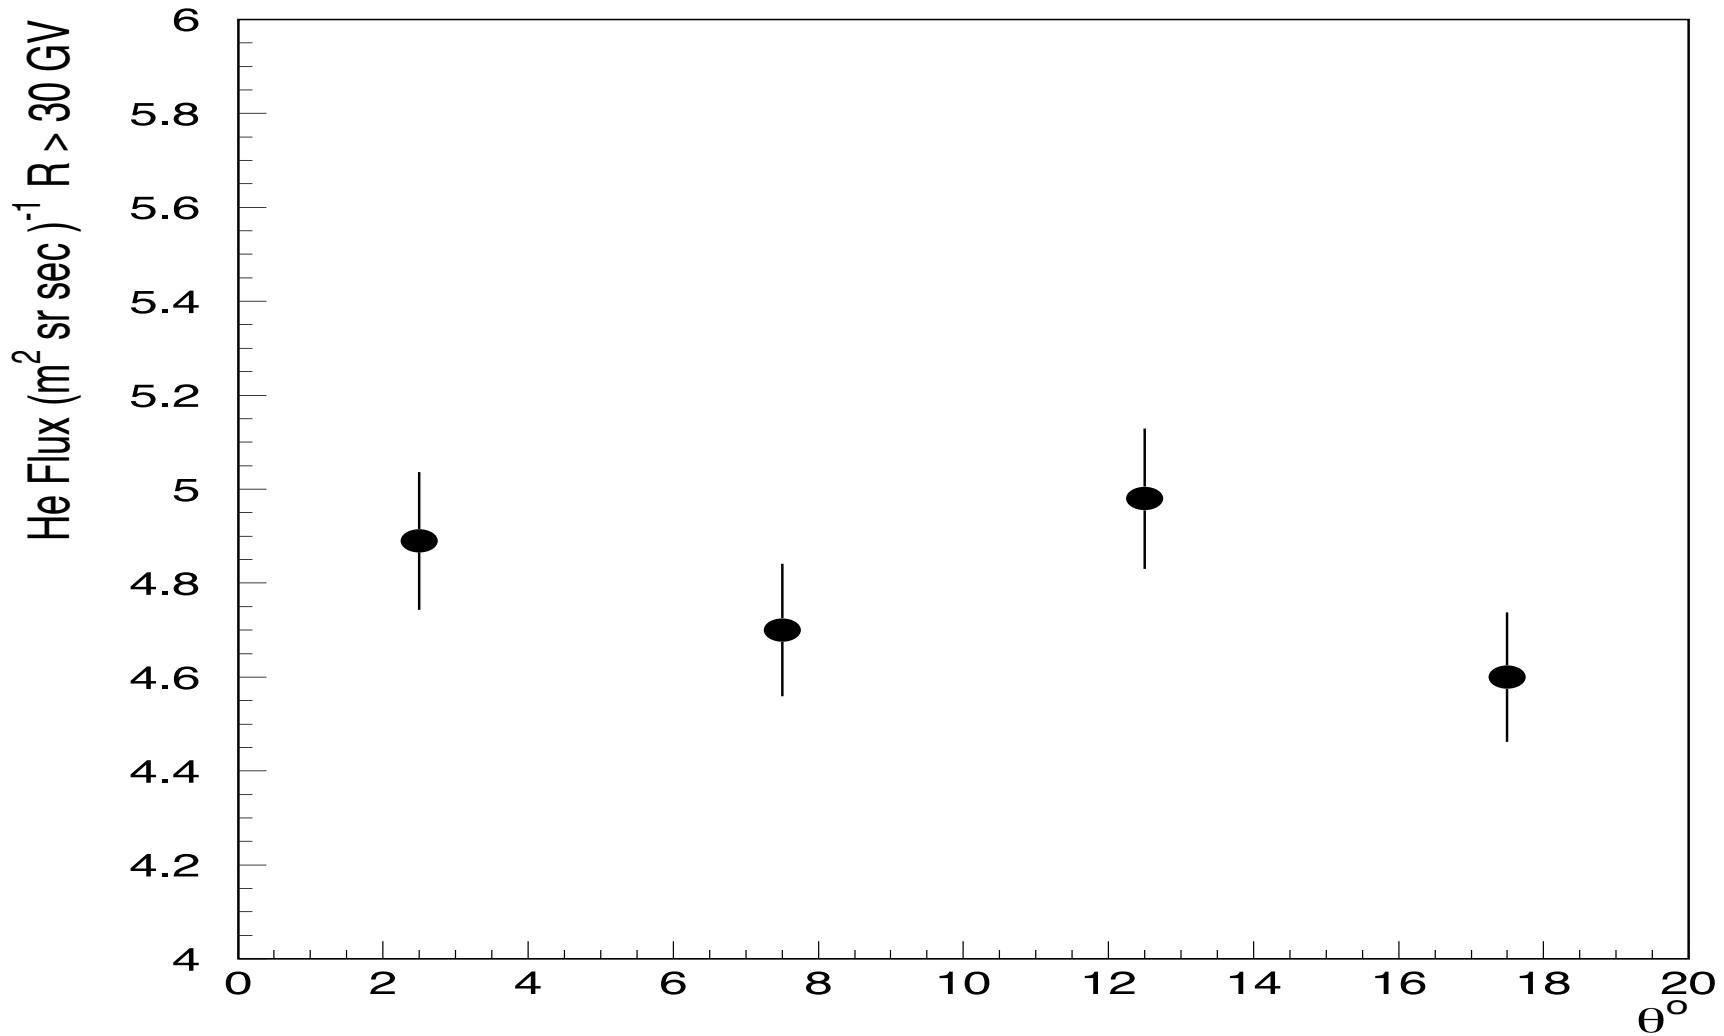

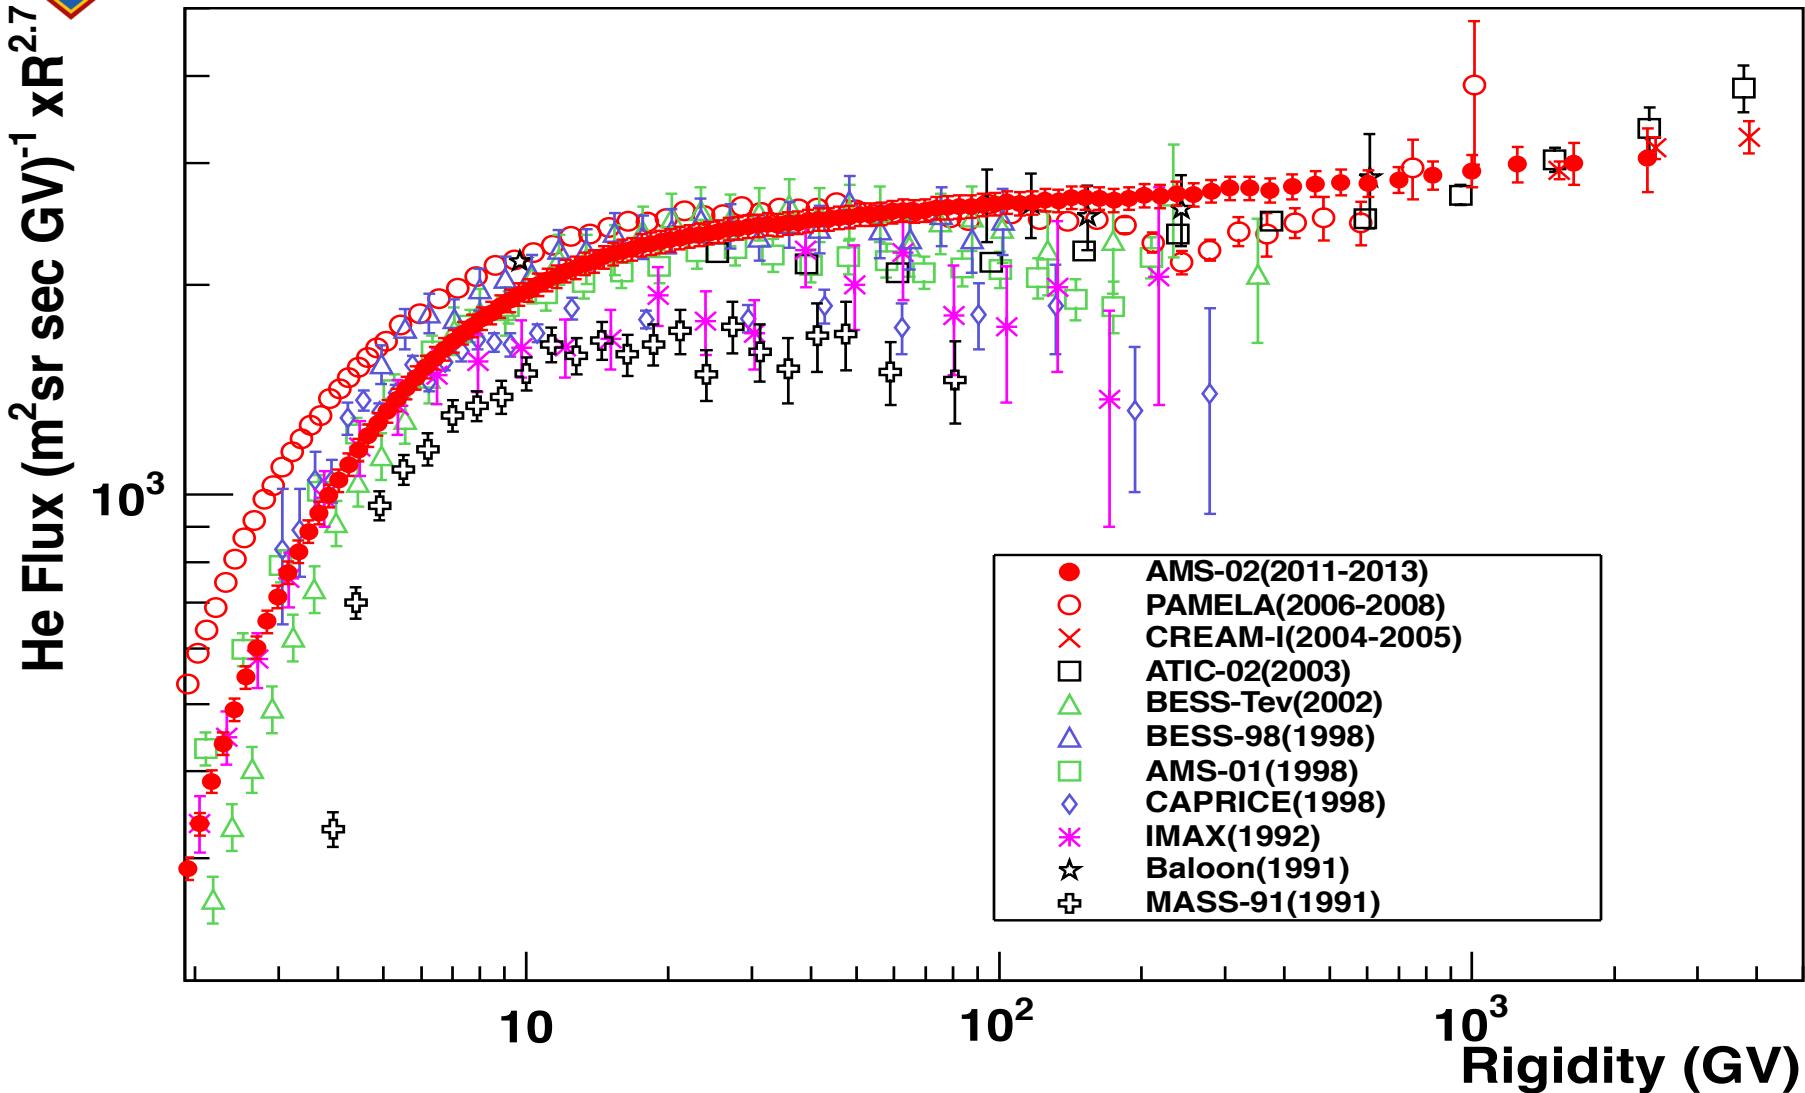

Rigidity>20 GV He Events Selected by Tight Cut on Tracker Layer1 Charge

Verification of He Flux Isotropy

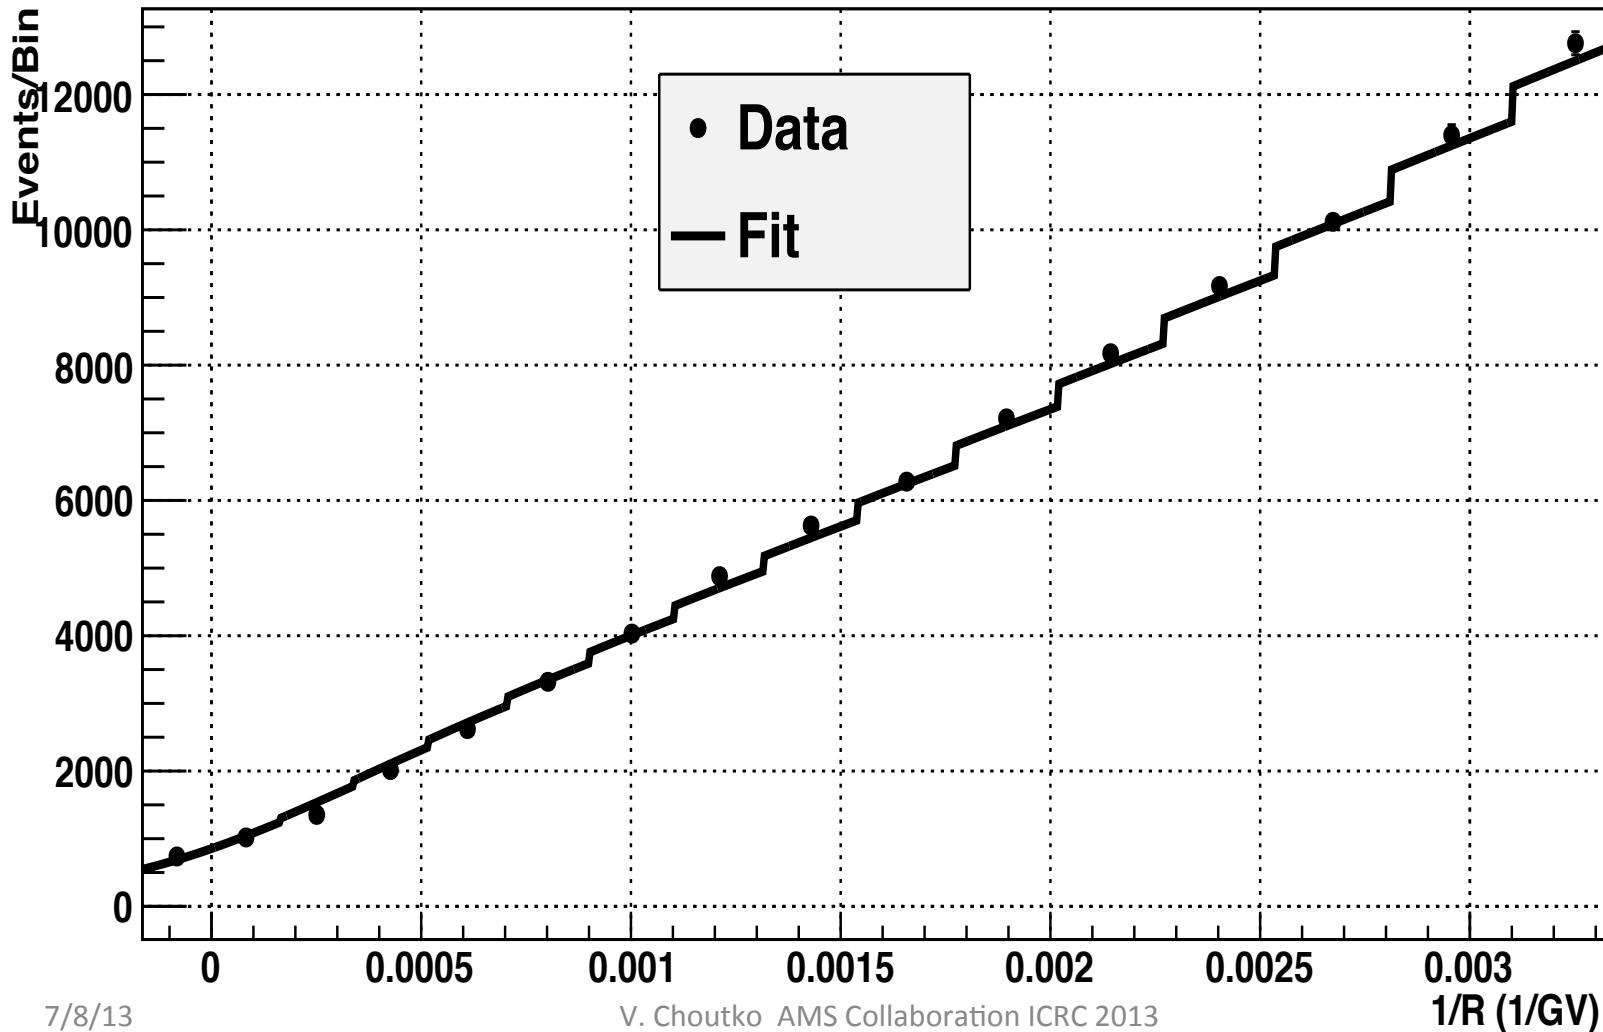

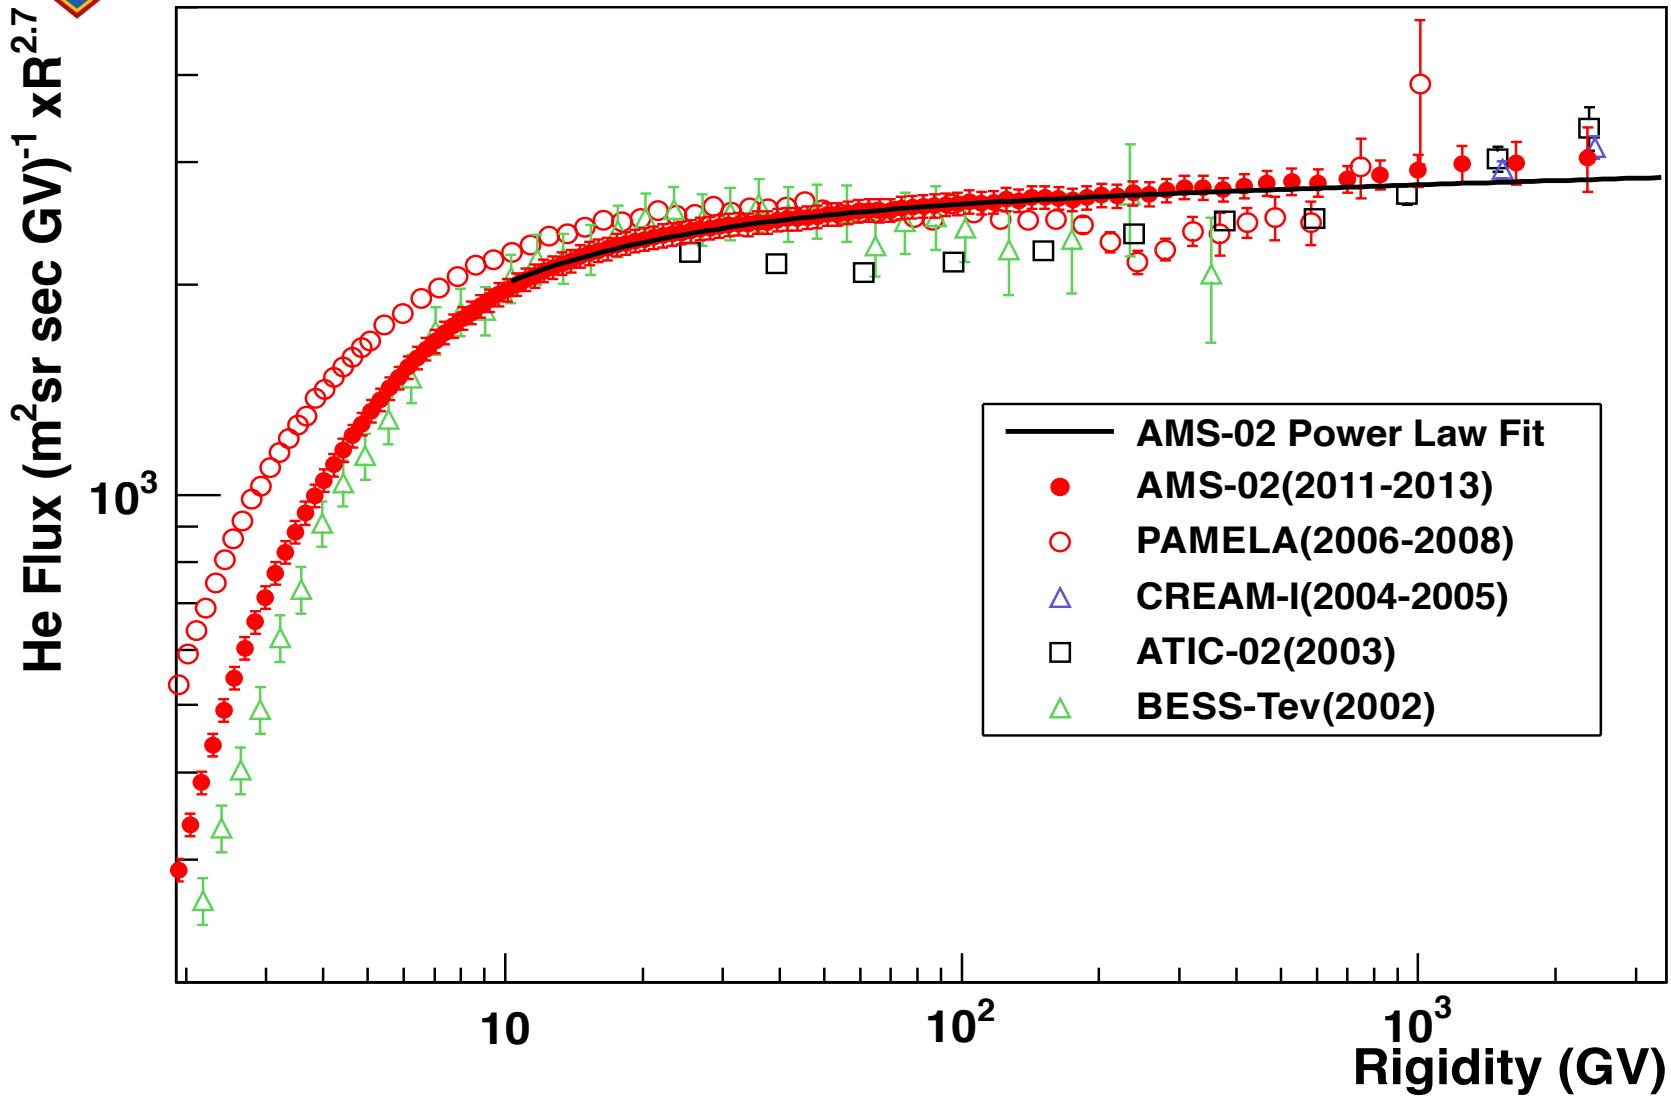

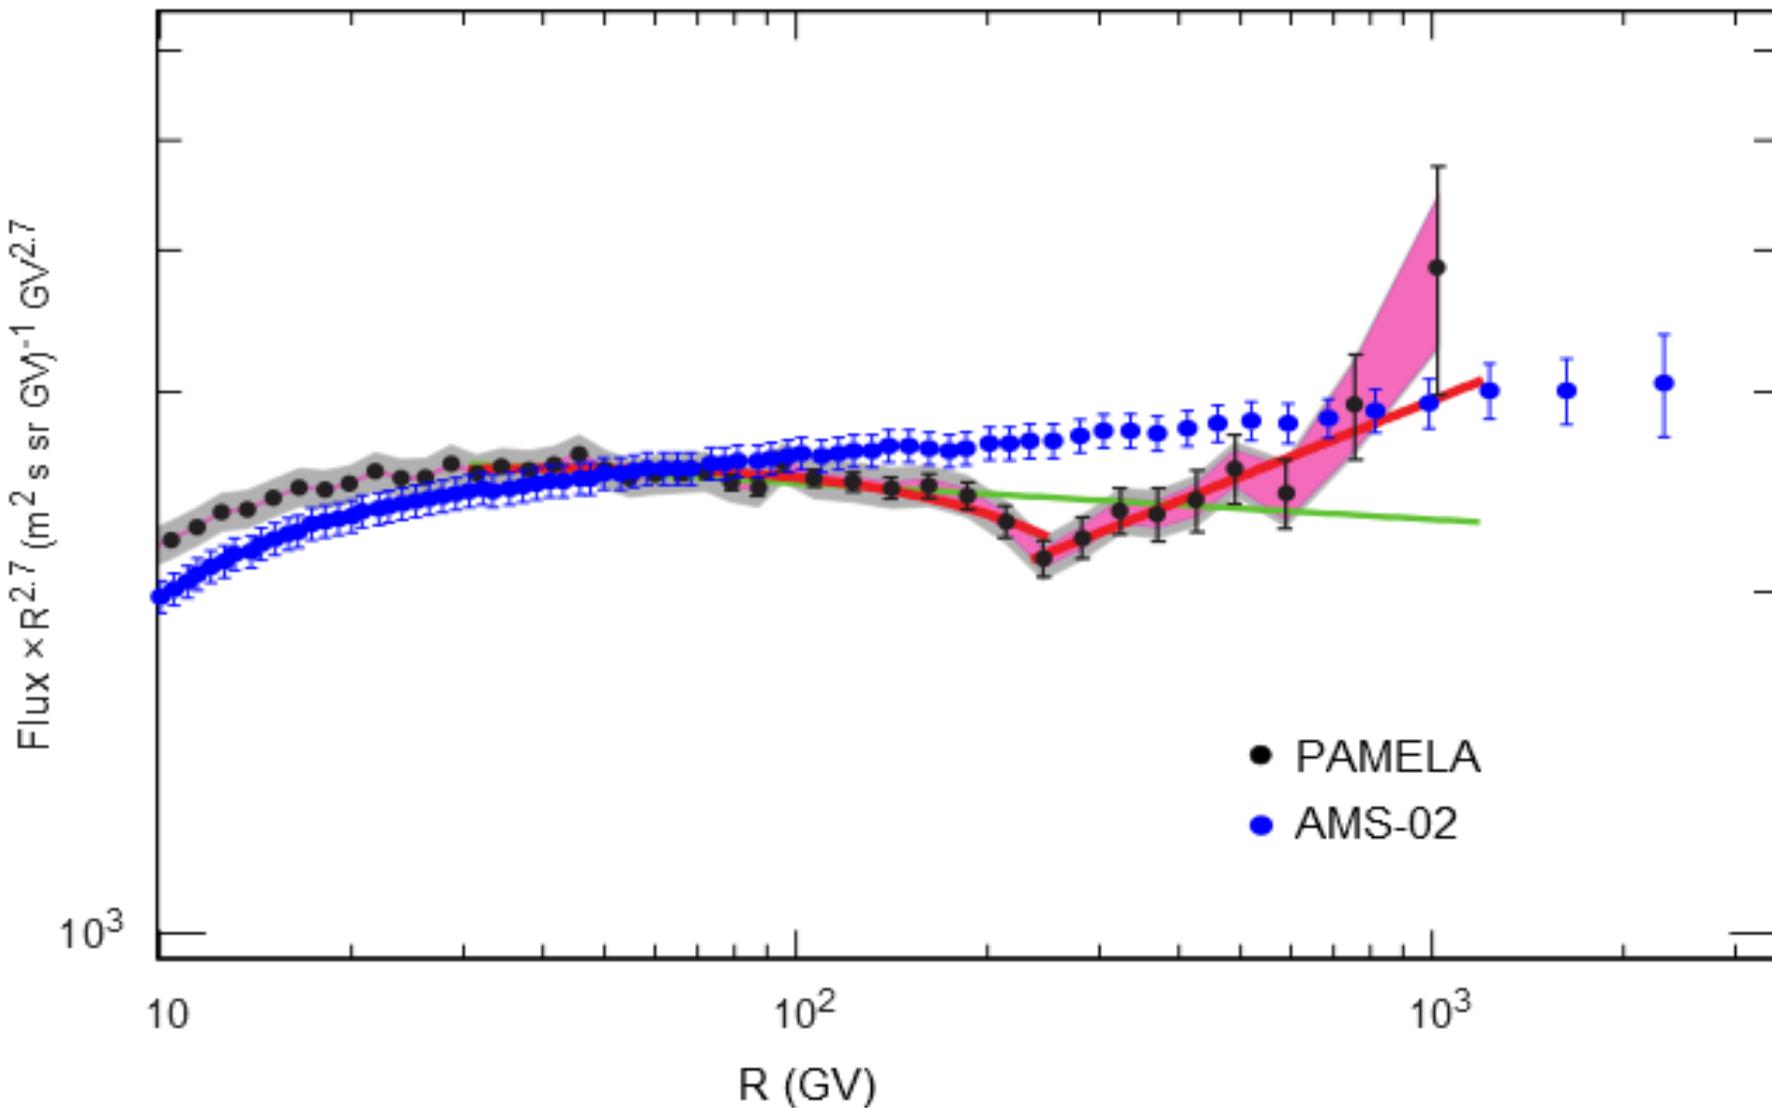

Data Fit with Power Law Function by Convolution with Resolution Function & Acceptance

$1/\text{Rigidity} < 0.033 ; \chi^2 = 51/60$

Conclusion

- Precision measurement of helium flux with AMS was done from 2 GV to 3.2 TV
- Above 10 GV spectrum can be parameterized by power law
- No fine structures was found in the spectrum
